Is the training year an effective way to manage training costs in the NHS? This paper analyses the extent to which training provided by the NHS can be regarded as effective, and whether this is influenced by the annual renewals of Training Board (TBo) contracts. The methodology used here to examine whether training is effective is to calculate the difference between the cost to the NHS of delivering training, and the estimated cost of providing that training if it was self-funded by the NHS, and then to examine whether this difference is greater than zero. Data from the NHS Information Centre is used. The data set covers the period April 1996 to March 2002, for training over the entire NHS. The results show that there is a net saving to the NHS of £17,848,000 a year as a result of training provided by the NHS. In addition, the results show that there is a significant seasonal pattern in the provision of training, with training taking place during the winter half term and the summer half term, and that this pattern is associated with the renewal of the Training Board contracts.

WASHINGTON — President-elect Donald J. Trump will have the most important decision facing the Federal Reserve in decades on Wednesday, and it won't be easy for him. Should he nominate a new Fed chief, the odds are that one of the two leading contenders would have a much easier time getting confirmed than his predecessor would have. President Obama nominated Jerome H. Powell, the Fed's current chairman, to succeed Ben S. Bernanke. But the problems Mr. Trump will face are not technical or procedural. They arise from the fact that for the next two years, he will control the White House and the Republican majority in the Senate. Mr. Trump's speech at the news conference Thursday in which he plans to announce his nominee for Fed chairman will set off a critical battle over the future of monetary policy in the United States.
