A: I found that even though the size was two times larger than the original file (~50MB in My Computer), the new file was only 2.5MB and it still contained the encryption. I copied the two 2.5MB files to a 2.5GB partition, then used the EaseUS Data Recovery Wizard to restore the original files back to that partition. The original file was successfully recovered. The reason why I still think the file was encrypted despite the size was because, under the zip file, there was a folder titled 'Docs', which contained files. I remember I had done this when experimenting with a previous encrypted file.

MRI in temporal lobe epilepsy: pathophysiology and clinical relevance. Epileptic activity in the temporal lobe can manifest many different symptoms. These epileptic activities may go undetected because of the complexity of the relationship between symptoms and underlying seizure pathophysiology. The recent development of new MRI imaging techniques has allowed us to obtain new information about the underlying seizure pathophysiology. We review MRI findings in different patients with temporal lobe epilepsy (TLE) and evaluate the role that MRI has for diagnosis and management.

Separate nuclear reactors, [4], [5], [6] allow for greater separation of the heat and power associated with the generation process from the heat and power to heat, cool and/or power the working areas of the facility. Separate power distribution is an advantage where the electrical power from a particular reactor is used to power the working areas of the nuclear power plant. This capability reduces the need for ducting, switchgear and other components of the power system. Integrated power distribution, [7], [8], [9] allows for a single source of electrical power to power the entire facility. In the past, electrical power from separate reactors would be distributed to the switchgear and other energy distribution equipment. The integrated distribution power systems of modern nuclear power plants often have direct use of nuclear power for cooling purposes, reduce the need for ducting and switchgear, reduce the number of connections required to bring the power distribution from the generator to the facilities, and provide a method to reduce the electrical losses associated with the cables and connections. Integrated cooling systems, [10], [11], [12] all reduce the size of the piping requirements of the cooling system, reduce the number of cooling loops, reduce the connections between the cooling loops, and reduce the heating effects of cryogenic gases.
