manipulation you will find that unix is  
a powerful operating system. in unix,  
powerful is synonymous with flexible.  
by allowing programs to be written to

work with many commands and file formats, the system can overcome the limitations of previous operating systems. because of this system flexibility, the system is often referred to as a general purpose operating system. while the system is general purpose, many tasks can be performed faster on unix than on many other systems. the basic operation of a unix program is to read data from the command line (or standard input), process that data, and write the results to standard

---

output and standard error. the code to process the data is typically stored in a function, which has its own independent input and output files. the input and output files that hold the results are called files. there are two types of files: regular and temporary. users and programs will specify special characters in the file and pass those arguments to a command. the shell does not parse the command line, instead it passes all characters in the string to the command. when the command line

finishes processing, it returns any results to the shell. in addition to normal commands, the shell can run programs with special features, such as shell scripts (see below).
