the brute-force cracking attack is the method of generating passwords by applying a given algorithm to the password guesser. most passwords are dictionary words or are generated by standard password-generating algorithms. a major weakness in the way passwords are generated is the ease with which passwords can be guessed. password cracking software usually tries out thousands of combinations (e.g., by generating a dictionary of common passwords), often over a large time frame. some password crackers are also capable of mining encrypted password databases. sha-1 (secure hashing algorithm) is the industry standard for hashing password data for the purpose of authentication. although it is a very fast hashing algorithm, sha-1 is also a very bad hashing algorithm. sha-1 has a birthday problem because the key space is very small. the birthday problem states that if a set of  $n$  numbers are generated, the chance that two of them will be the same is proportional to  $n(n-1)/2$ . this means that it is extremely likely that two random passwords will be the same even if they are completely unrelated. a string of 6 characters will be identical to 99.9% of all other strings of the same length, even if they were generated from completely different sets of characters. this is why experts agree that sha-1 is too easy to crack. dongle logic only allows a certain amount of writes, or time, before a device will be reset and lose its settings. i have found that 2-4 writes to the device is enough to cause a reset. if you're seeing "the driver descriptor says the physical device contains a logical block address" or "the physical device can't be read. it may have been removed, or the address may be in use.", you need to write to the device a few more times to get it to reset.

## Tis 2000 Dongle Crack Rar Pass

i am in the middle of a new crack of tis2000 i had a chance to play with it yesterday. so far so good! it did take a little longer than usual to crack it, but thats good. i did the same thing you did by using the keygen.txt file provided. the registration was smooth sailing. once i got the crack, i tested it out and i was able to do some things i wouldnt normally be able to do, like manually login to the web site, and the browser immediately pulls up the login page. this is all very nice. everything worked as it should. 1. i get a blank page when i try to login. i

figure the only way to fix this is to wipe the ops cookies. i am running ie8 on windows 7 and i have cookies enabled. i have also tried removing the saved password and removing everything from the cache. so far nothing has worked. i have also tried deleting the cookies from my browser. preventing a dictionary attack: since a dictionary attack uses a list of words, it is possible to prevent such an attack by not using words that are easily guessed from dictionaries. for example, common passwords include the word "password", names of software and hardware used, names of people and software they own, and so on. use of such easily guessed words may not be a problem if the password must be reused on other sites. however, if the password is only used on one site, and there is no way of getting the dictionary, it can be a problem. one solution is to use strong random characters instead of words. another is to use a password that is very difficult to guess, for example a phrase or an original sentence. a more secure option is to use a password that is random, for example one of the many available random password generators. 5ec8ef588b
