This product was developed to work on all the Windows OS operating systems including Windows 2000, 2003, 2008, 7, 8, XP and Vista.Q: Can I remove the first character from a text field in java? I have a field which contains the address for an entity. What I would like to do is only take the first character of this field (without the ",") and change it to the address of the entity. I tried the following method but it didn't work. String address = "sdfsd"; address.substring(0, address.indexOf(",")); A: You want address.substring(1) Because of the variety of different available types of vehicles and because of the different and varying energy sources used to power such vehicles, such as gasoline, electricity, diesel fuel, and the like, there is often a need to adapt an internal combustion engine to use the fuel source of the particular type of vehicle which is employing such internal combustion engine. Although many different designs of internal combustion engines have been produced over the years, the most common types of internal combustion engines employ a carburetor or other type of air intake system for admitting air into the combustion chambers. More specifically, internal combustion engines, and particularly carbureted internal combustion engines, generally operate on the principle of supplying a predetermined air-fuel ratio to the air-fuel mixture being burned within the combustion chamber of the engine. The air-fuel mixture which enters the combustion chamber is then ignited so as to generate a pressure wave that is transmitted to the engine's crankshaft. This pressure wave corresponds to the pressure generated when an object is dropped, and the duration of such pressure wave has been found to be the basic factor in the amount of energy that can be obtained from the engine. This energy, or work, is obtained as the products of work developed by the pressure wave (i.e., the work done by the pressure wave), are

returned to the crank shaft through the engine's connecting rod. The energy thus obtained is transferred to the vehicle's wheels through the vehicle's transmission. It is this transfer of energy from the pressure wave which allows the internal combustion engine to be used to propel the vehicle. In addition, the speed of the crankshaft is a function of the speed of the vehicle's wheels, that is, the speed of the crankshaft is directly proportional to the rate of energy transfer between the pressure wave and the crankshaft. In addition to being adapted to use a particular type of fuel source, internal combustion engines are also adapted to use a variety of different air intake systems. More specifically, a variety of different types of carburetion systems have been developed for supplying the correct air-
